## Dear Lanny:

Confirming our recent discussion of the \_\_\_\_\_DTR transparency material to be used in the automatic viewgraph maker, the following minimum specifications will hold.

- 1. Gamma range: Approximately 0.75 to 1.1 with a nominal of 1.0.
- 2. Maximum density: At least 1.3.
- 3. Base plus fog: Nominal of 0.04.
- 4. Resolving power: Not less than 25 1/mm.
- 5. Useful exposure latitude: Approximately 1.0 log exposure units. This corresponds to eight or nine steps on a gray scale ( $\Delta D$  of .15 on gray scale).
- 6. Density range: At least 1.25.
- 7. Stability: We can guarantee the stability of the transparent base material for at least 90 days after processing. Tests on the paper have indicated an image permanence of over 12 months; however, we simply have not tested the transparent base material to this extent. I should point out that, fundamentally, the transparent base material should last longer since the base does not absorb as much processing solution as does the paper base.

We are interested and would recommend that you purchase all the required photographic materials and chemistry from us. Not only will this ease the logistics problem, but it will enable us to better insure the quality of the product being supplied. The result will be, of course, to insure the quality and performance of the equipment.

If you have any further questions, please feel free to call me.
